

Are security agents working?

Network visibility study findings show security agent can't do it alone.

Security agents on devices help identify and manage devices on the enterprise network. Yet, **there are several significant problems if a company relies too heavily on security agents.**

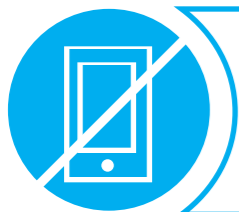

Unless the proper security agent is installed on a device, the security team can **lose visibility** of the device on the network.

1

2

Security agents provide a **false sense of security**. Software upgrades or patches installed on endpoints may not reach their destinations.

A—B

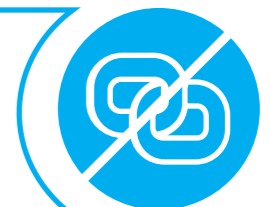

In most cases security agents **cannot be installed** on personal (BYOD) devices connecting to the network.

3

4

There is no accounting for IoT devices (industrial and/or healthcare equipment, etc.) that cannot accept software agents. IoT devices cannot be managed with traditional tools.
